

This course has expanded my view on programming as a whole and re-sparked my interest in programming. After years of applying for internships with no response, I almost lost the passion. I've been working with full stack technologies and C for so long I forgot what it was like to learn something completely different. Personally, I enjoyed Haskell, even if I don't see its purpose much in the real world. It was actually incredibly helpful in understanding equivalent list-based functions in JavaScript. On the other hand, Rust is maybe going to be the only helpful thing (workplace wise, no offence) that I will take from school. With it blowing up in backend-technologies and the move away from apps to web-apps, it will be a key asset in my tool belt for optimization (too bad I was better at Rust).
