

CMPT 383: Vitamin #12

Anders Miltner
miltner@cs.sfu.ca

This vitamin exists for you to reflect a bit on the course, and think about different languages. I want you to write between a paragraph and a page describing your thoughts on what you thought were useful and useless parts of what you learned. Are you planning on still using the languages you're used to? If so, why? And is there any different ways you will approach programming in them? If not, why not? And why are you thinking about using different languages? Are there any languages or paradigms that you didn't learn in your education so far? Why are you interested in them, and what do they do different than other languages.

I'm not putting a minimum length (beyond just a paragraph), because I'd much prefer that you take some time and think about it, and say your real thoughts, rather than just pad your response with an LLM. Please write your real thoughts, even if your thoughts are just "Haskell Sucks, I'm using C++ forever."
